Data Frame

Data frames are envelopes that are transmitted and processed through a positioning model. These frames are created by source nodes (e.g. sensors) and contain one or more data objects needed to process the frame.

A frame should contain a single reading of a sensor (such as an image of a video stream or current acceleration) and not permanent or calculated information.

VideoDataFrame	IMUDataFrame	RFDataFrame																						
<table border="1"><tr><td>uid</td><td>timestamp</td></tr><tr><td>source</td><td>CameraObject</td></tr><tr><td>uid: "camera", position: { x: 2, y: 5, z: 3 }, projection: ..., width: 1280, height: 1024</td><td>Detected object Detected object Detected object</td></tr><tr><td>Image</td><td></td></tr></table>	uid	timestamp	source	CameraObject	uid: "camera", position: { x: 2, y: 5, z: 3 }, projection: ..., width: 1280, height: 1024	Detected object Detected object Detected object	Image		<table border="1"><tr><td>uid</td><td>timestamp</td></tr><tr><td>source</td><td>DataObject</td></tr><tr><td>uid: "imusensor", position: { x: 0, y: 0, linearVelocity: { x: 1, y: 0 } }</td><td>No additional objects</td></tr><tr><td>Acceleration</td><td>Sensor Frequency</td></tr></table>	uid	timestamp	source	DataObject	uid: "imusensor", position: { x: 0, y: 0, linearVelocity: { x: 1, y: 0 } }	No additional objects	Acceleration	Sensor Frequency	<table border="1"><tr><td>uid</td><td>timestamp</td></tr><tr><td>source</td><td>RFReceiverObject</td></tr><tr><td>uid: "wifiscanner", relativePositions: [{ obj: "AP1", distance: 5 }, { obj: "AP2", distance: 8 }]</td><td>AP1 DataObject AP2 DataObject</td></tr></table>	uid	timestamp	source	RFReceiverObject	uid: "wifiscanner", relativePositions: [{ obj: "AP1", distance: 5 }, { obj: "AP2", distance: 8 }]	AP1 DataObject AP2 DataObject
uid	timestamp																							
source	CameraObject																							
uid: "camera", position: { x: 2, y: 5, z: 3 }, projection: ..., width: 1280, height: 1024	Detected object Detected object Detected object																							
Image																								
uid	timestamp																							
source	DataObject																							
uid: "imusensor", position: { x: 0, y: 0, linearVelocity: { x: 1, y: 0 } }	No additional objects																							
Acceleration	Sensor Frequency																							
uid	timestamp																							
source	RFReceiverObject																							
uid: "wifiscanner", relativePositions: [{ obj: "AP1", distance: 5 }, { obj: "AP2", distance: 8 }]	AP1 DataObject AP2 DataObject																							

Creating data frames

OpenHPS is a framework that processes sensor information to retrieve a position for one or more data objects. These objects are contained within an envelope called a data frame.

```
import { DataObject, DataFrame } from '@openhps/core';  
  
const myObject = new DataObject("bsigner", "Beat Signer");  
const frame = new DataFrame();  
frame.addObject(myObject);  
  
(method) DataFrame.addObject(object: DataObject): void
```

A basic data frame supports the addition of objects. Extended versions of this basic data frame also add additional sensor data.

Creating a custom data frame

Similar to data objects, decorators have to be used to indicate a serializable data frame.

```
import {  
  DataFrame,  
  SerializableObject,  
  SerializableMember  
} from '@openhps/core';  
  
@SerializableObject()  
export class QRDataFrame extends DataFrame {  
  public rawImage: any = undefined;  
}
```

What is OpenHPS?

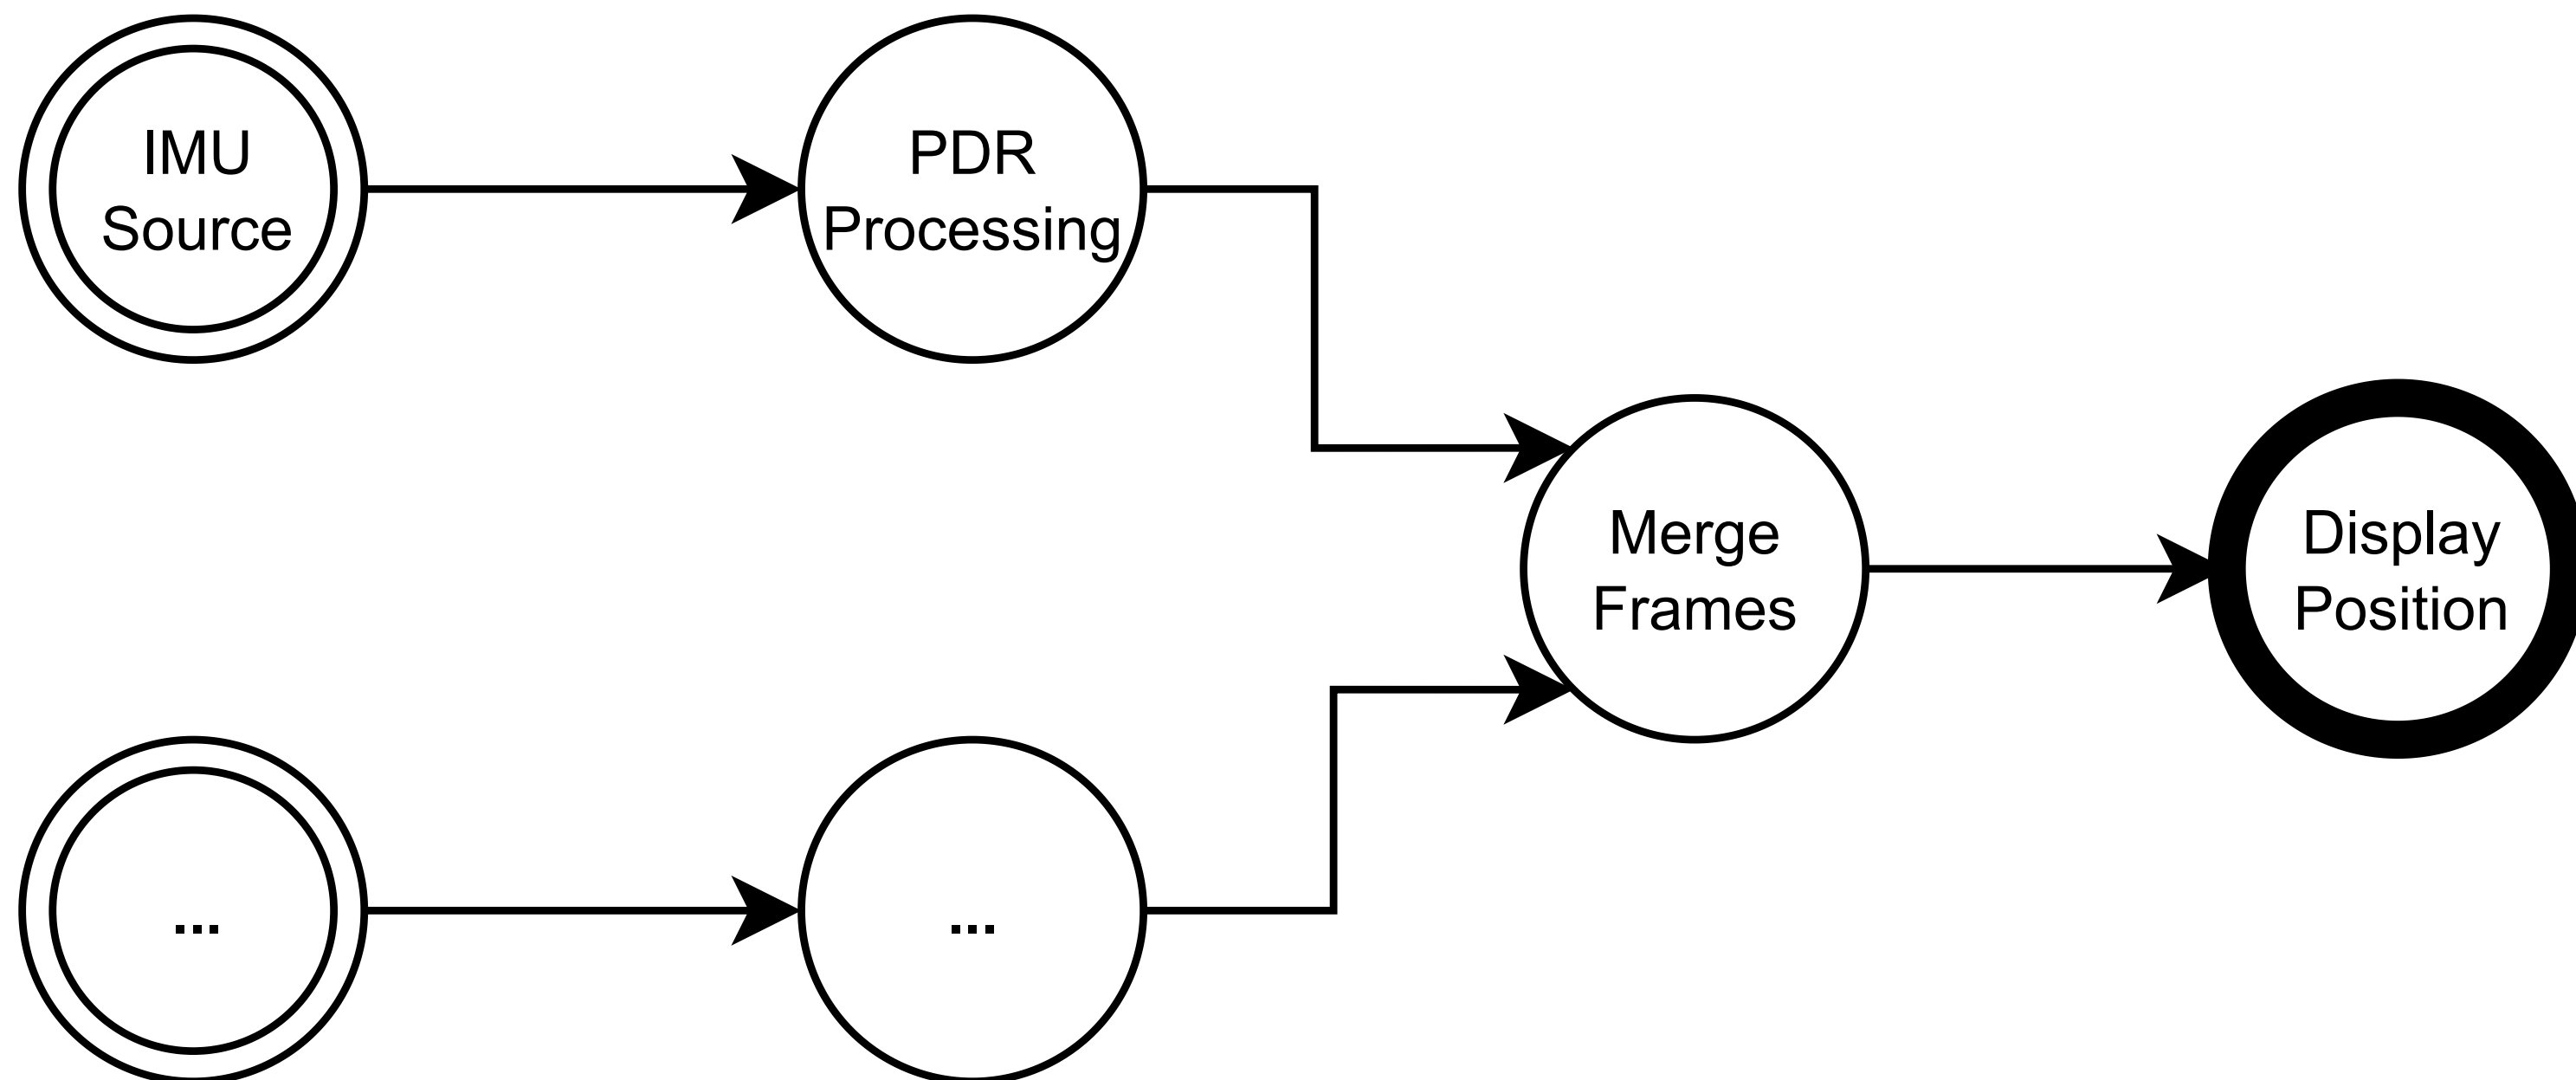

An Open Source Hybrid Positioning System

- ▶ Any technology
- ▶ Any algorithm
- ▶ Various use cases
- ▶ Flexible processing and output
 - Accuracy over battery consumption, reliability, ...
- ▶ Aimed towards
 - Developers
 - Researchers

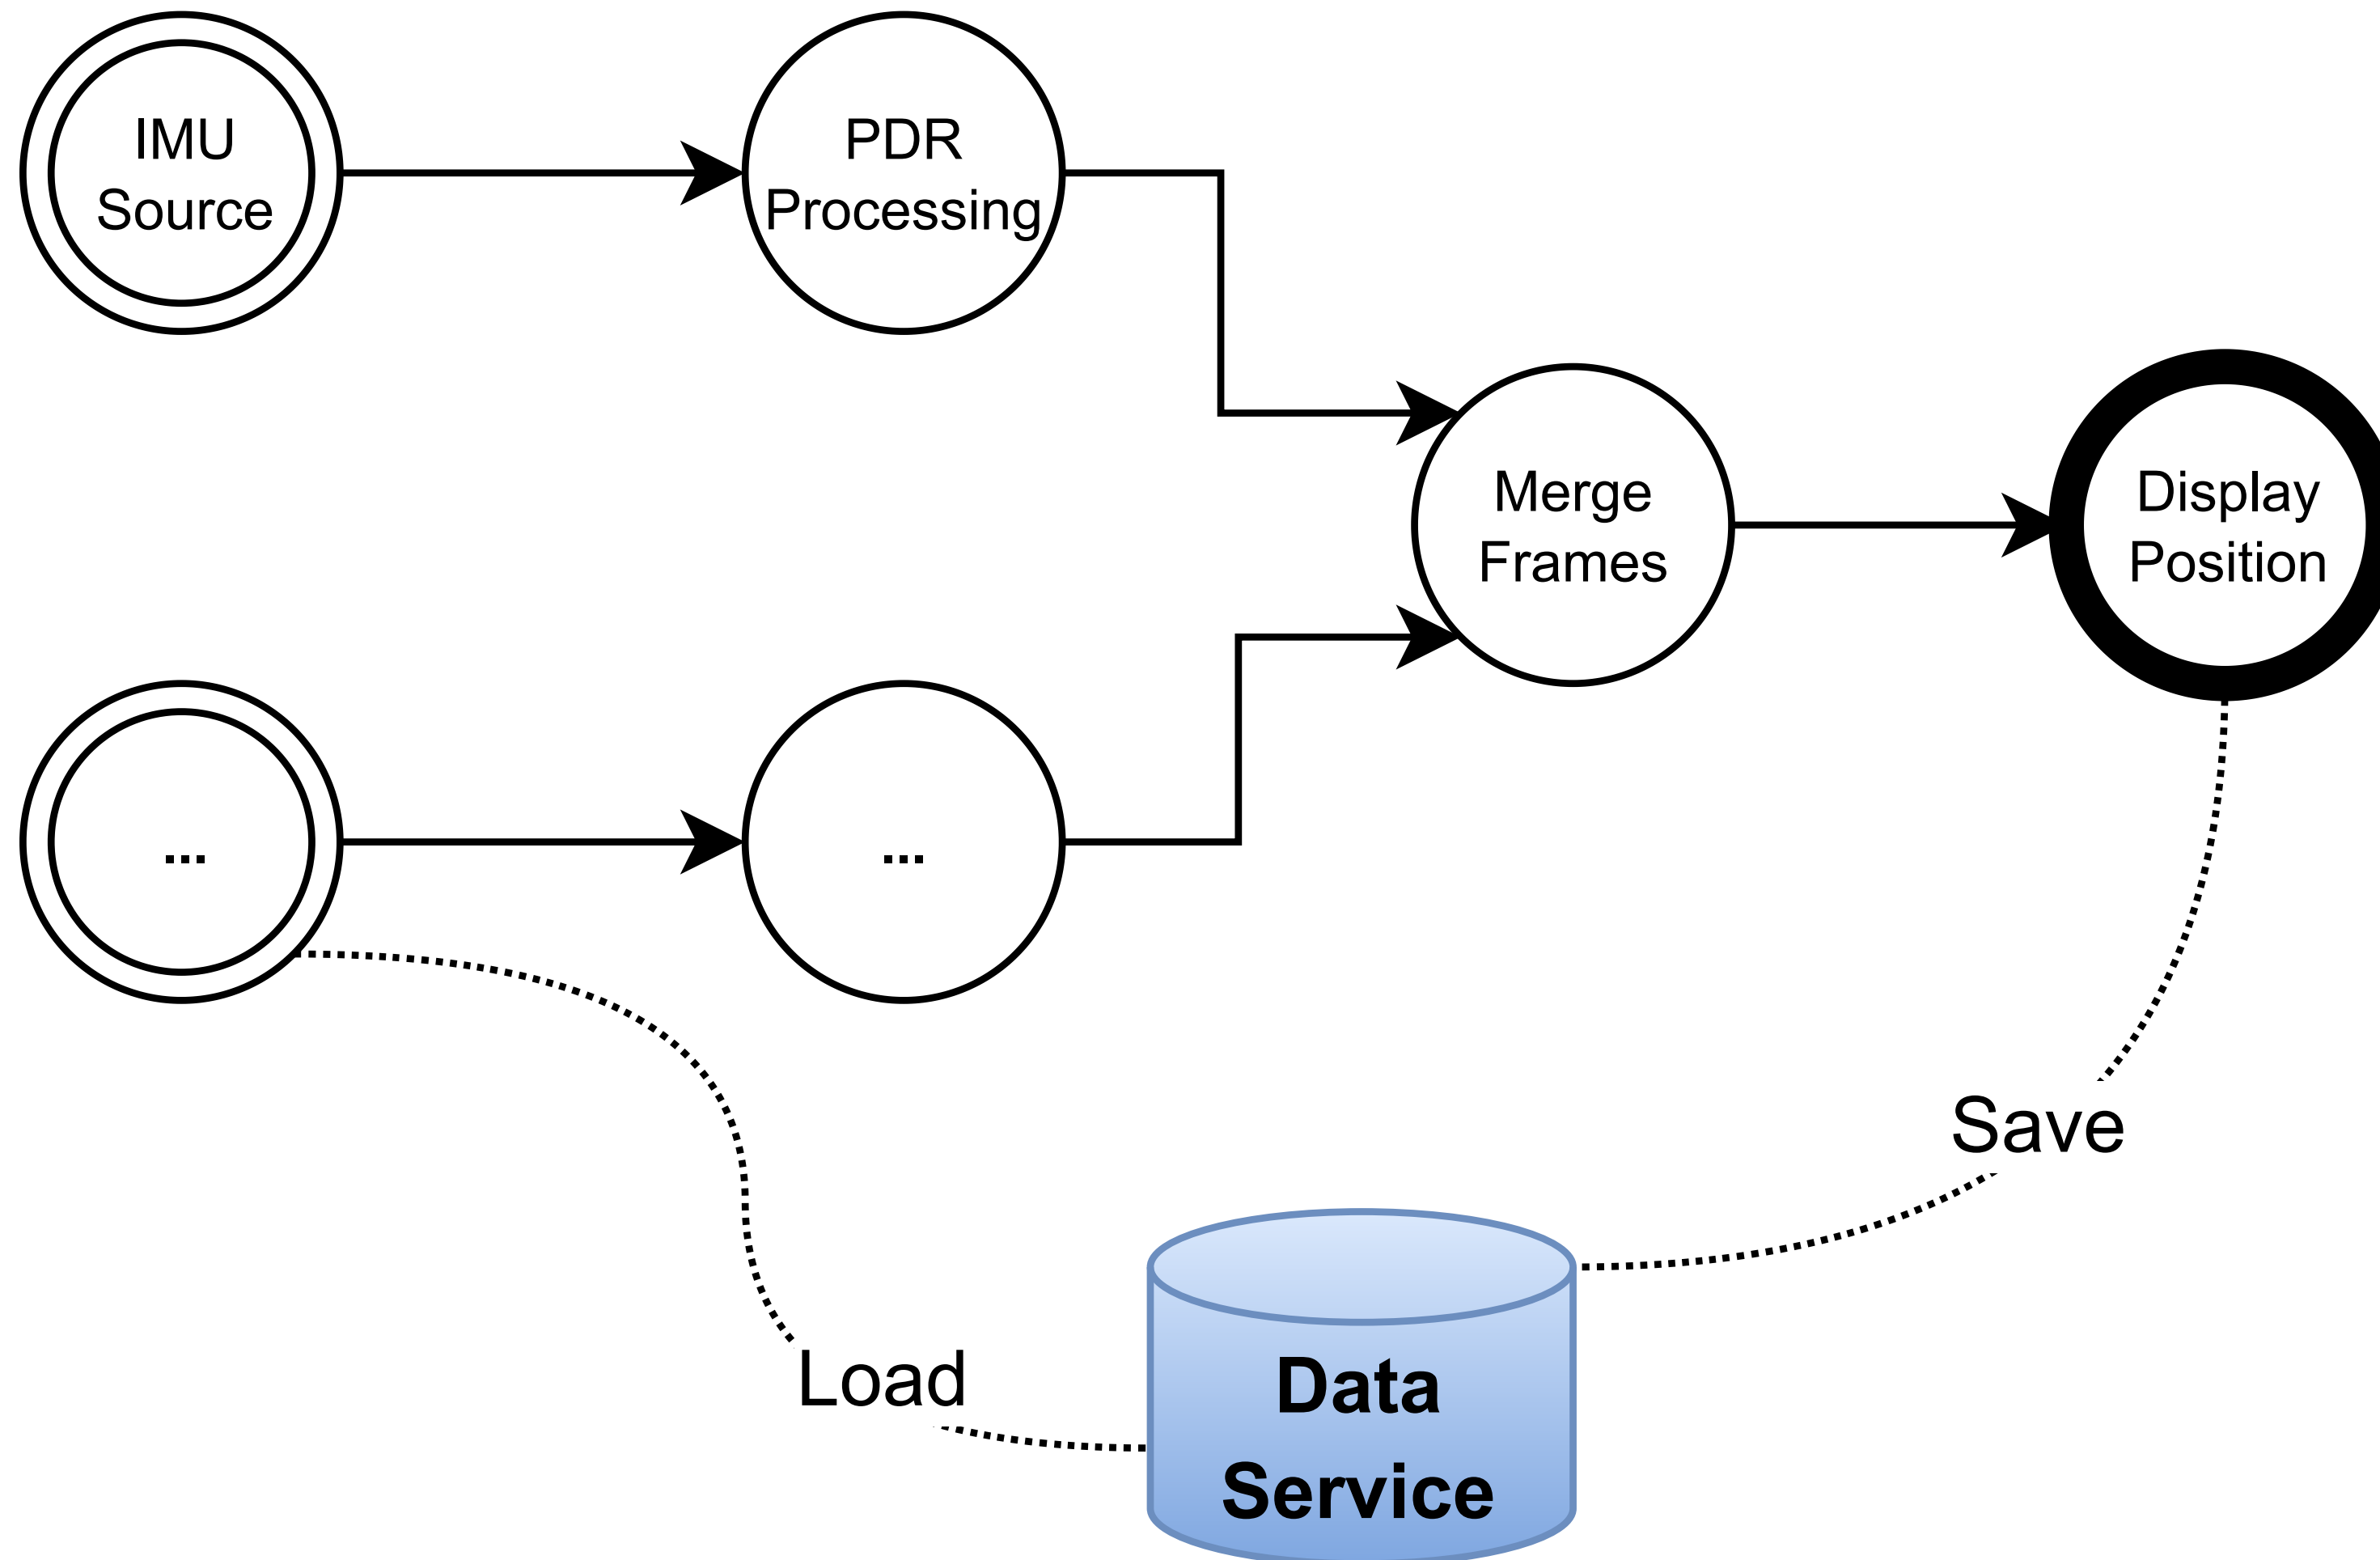

Process Network Design

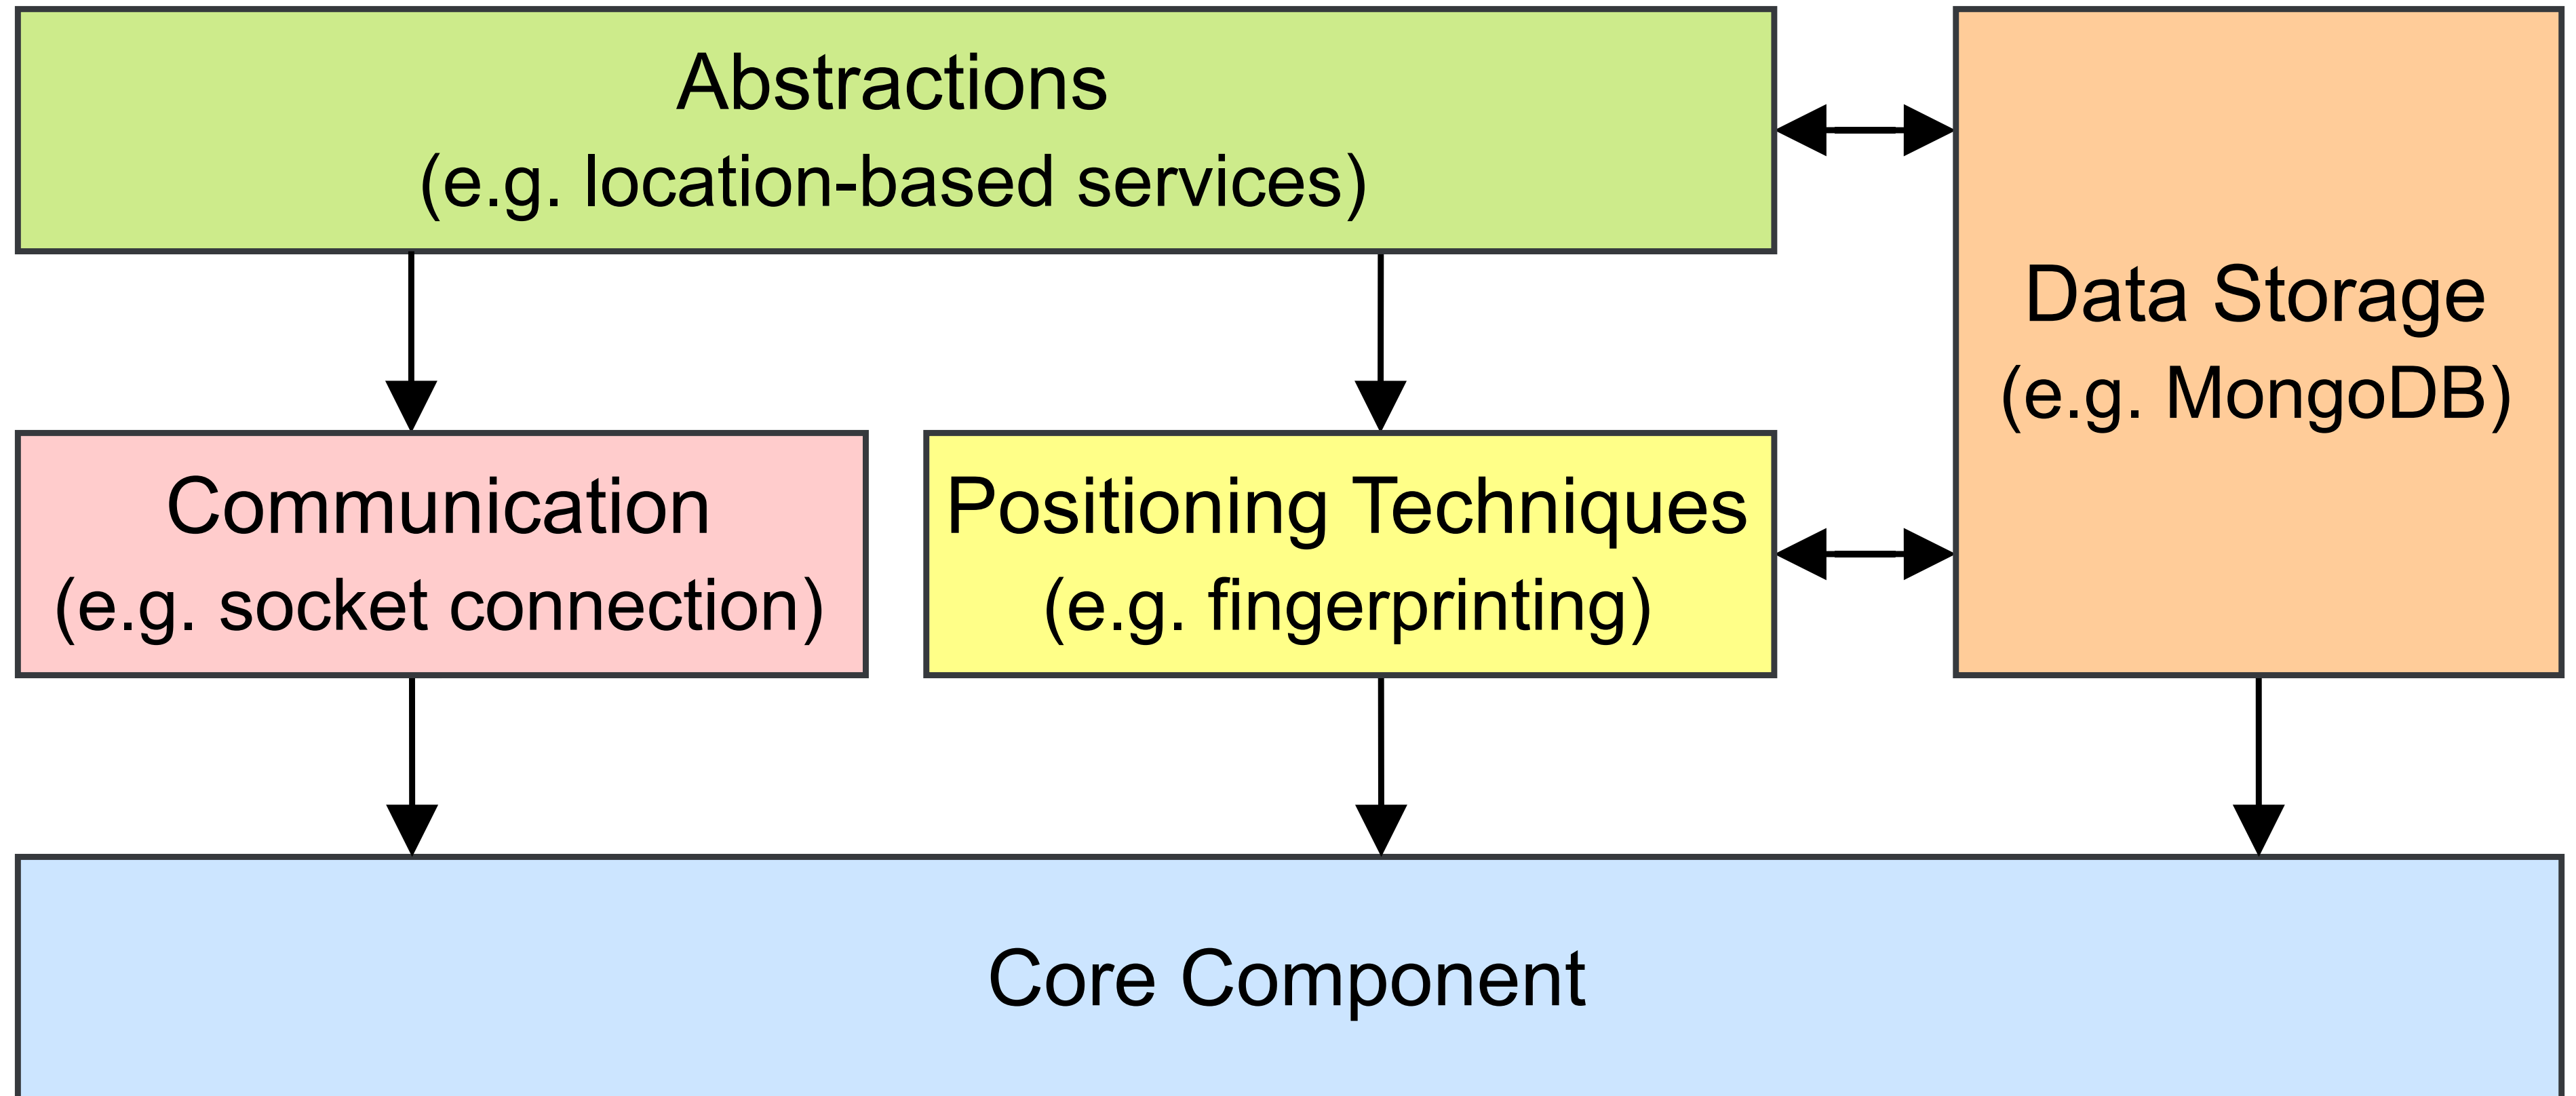

Process Network Design ...

Process Network Design ...

Modularity

Data Processing

Knowledge

Raw Data

Processed Data

DataObject

Absolute and Relative Positions

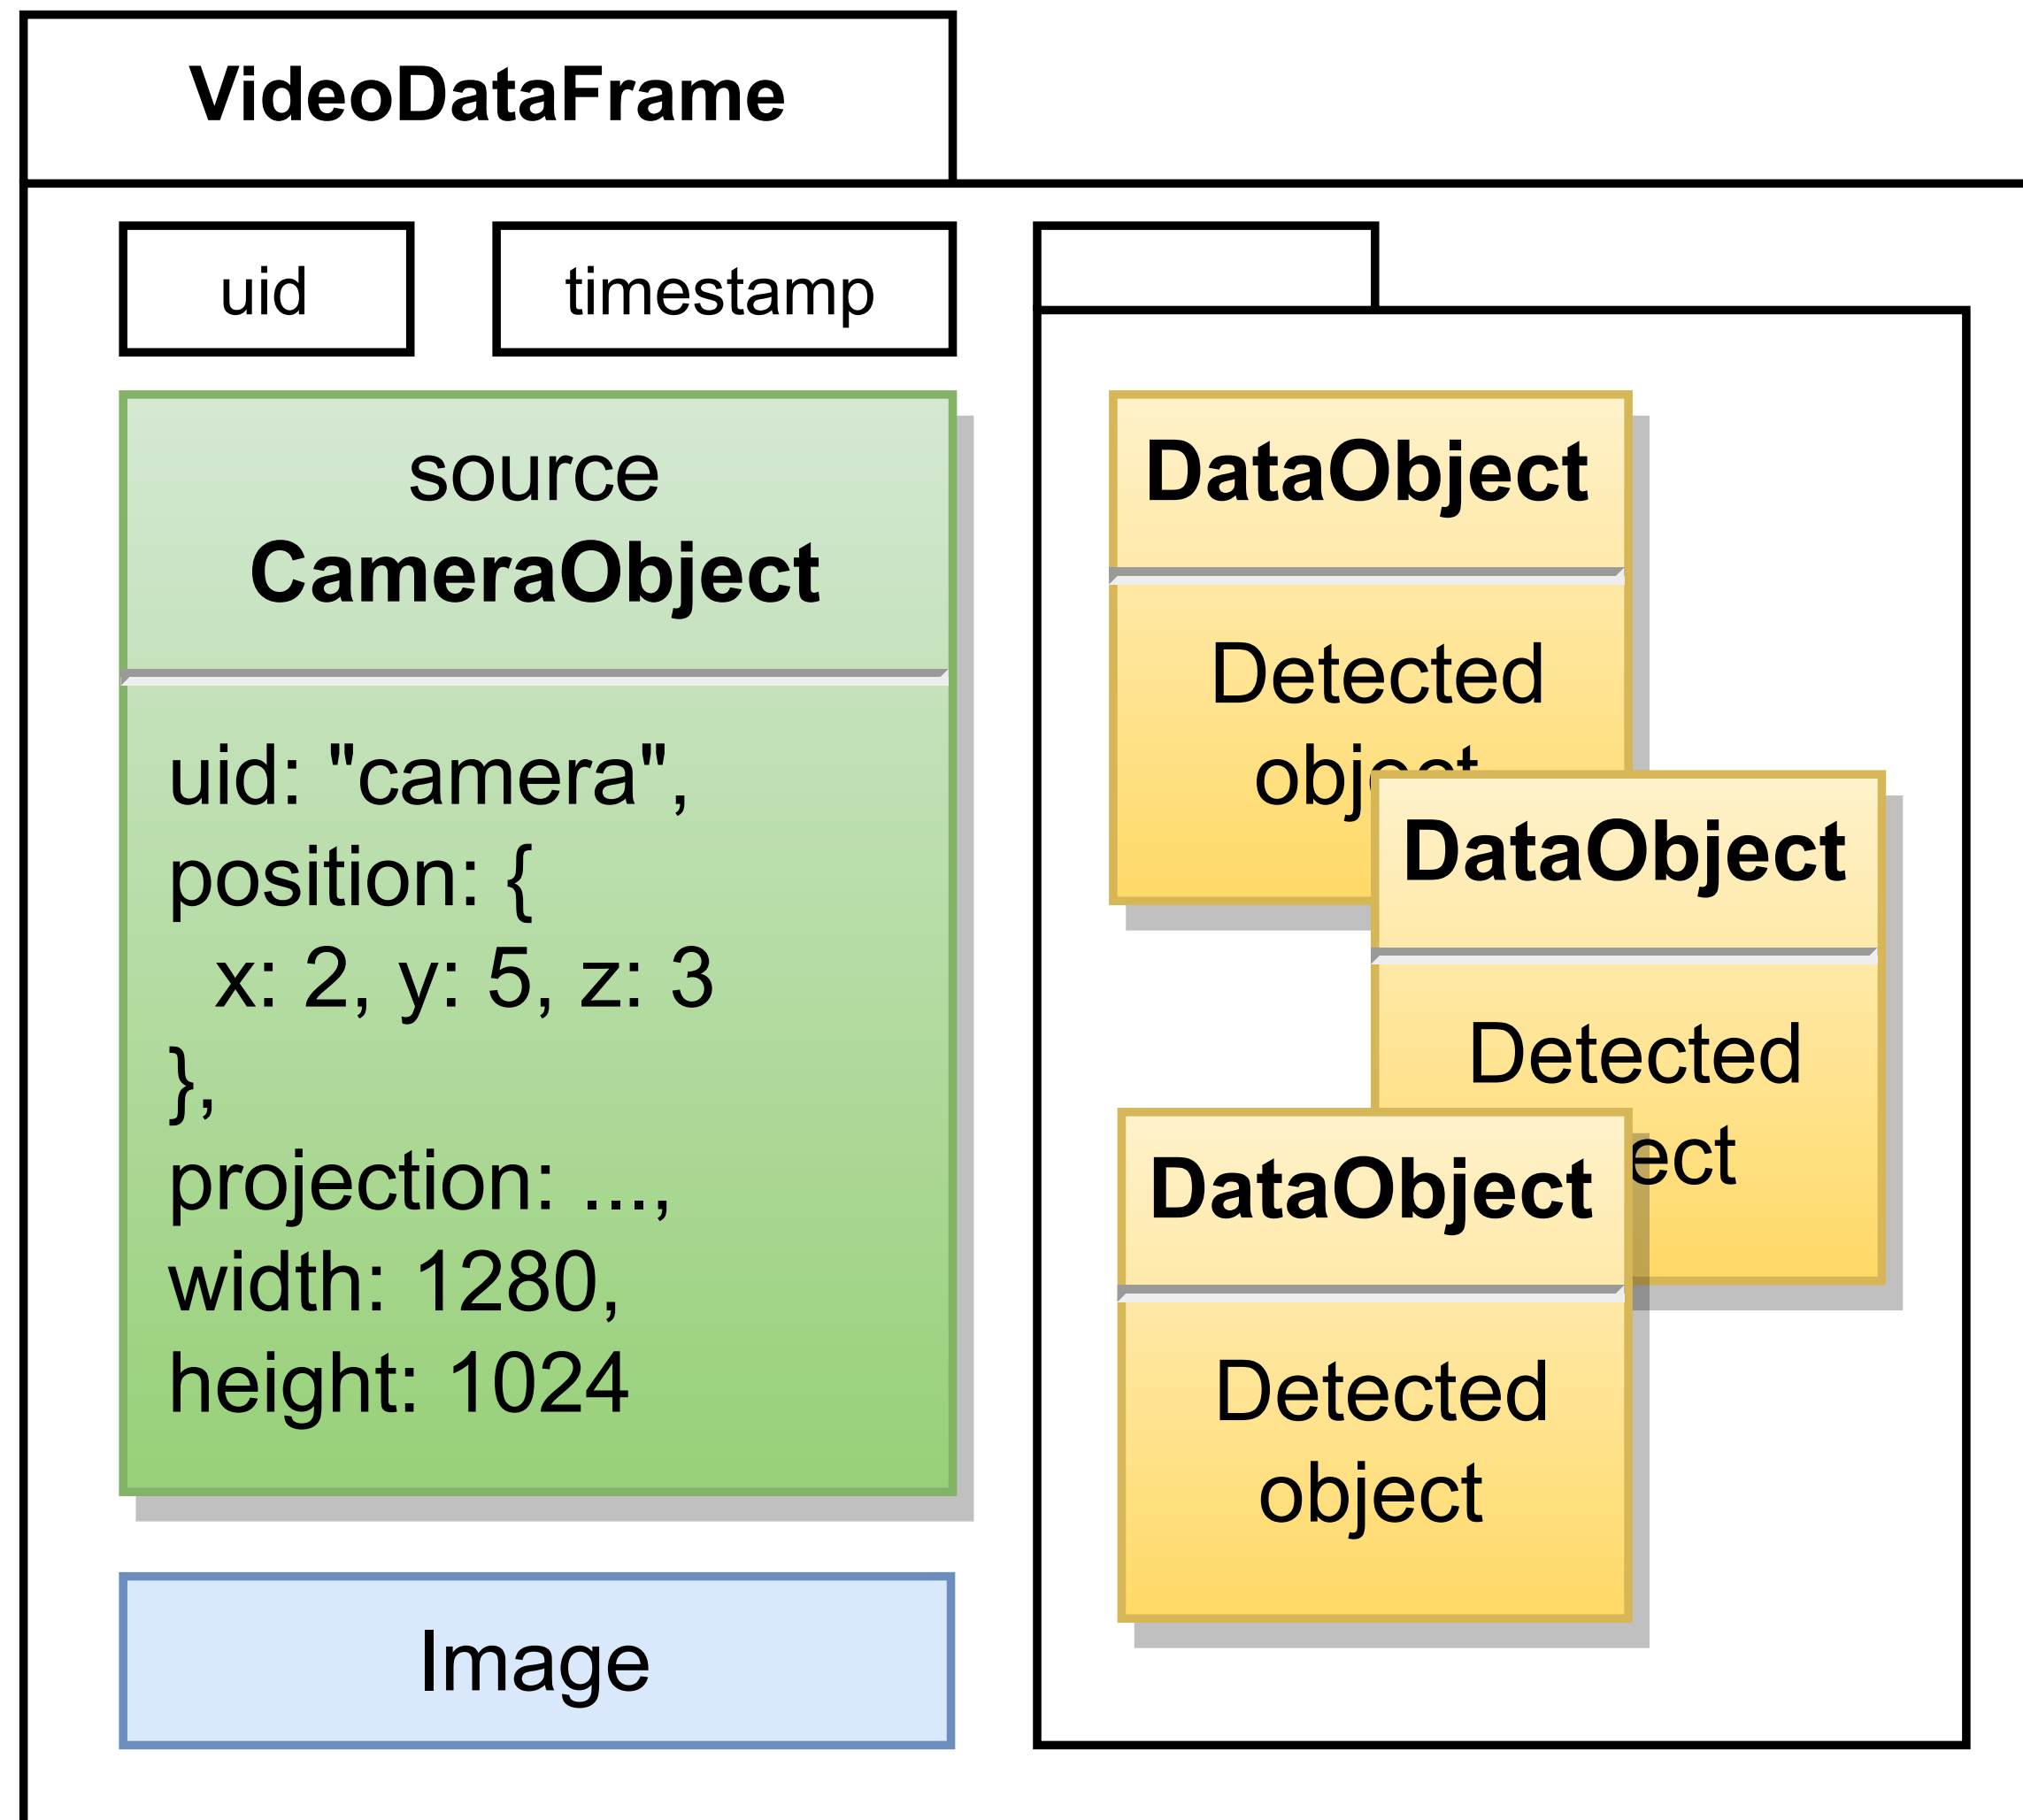

Absolute

- ▶ 2D, 3D, Geographical, ...

Relative

- ▶ Distance, angle, velocity, ...
- ▶ Relative to another *object*

DataFrame

SymbolicSpace

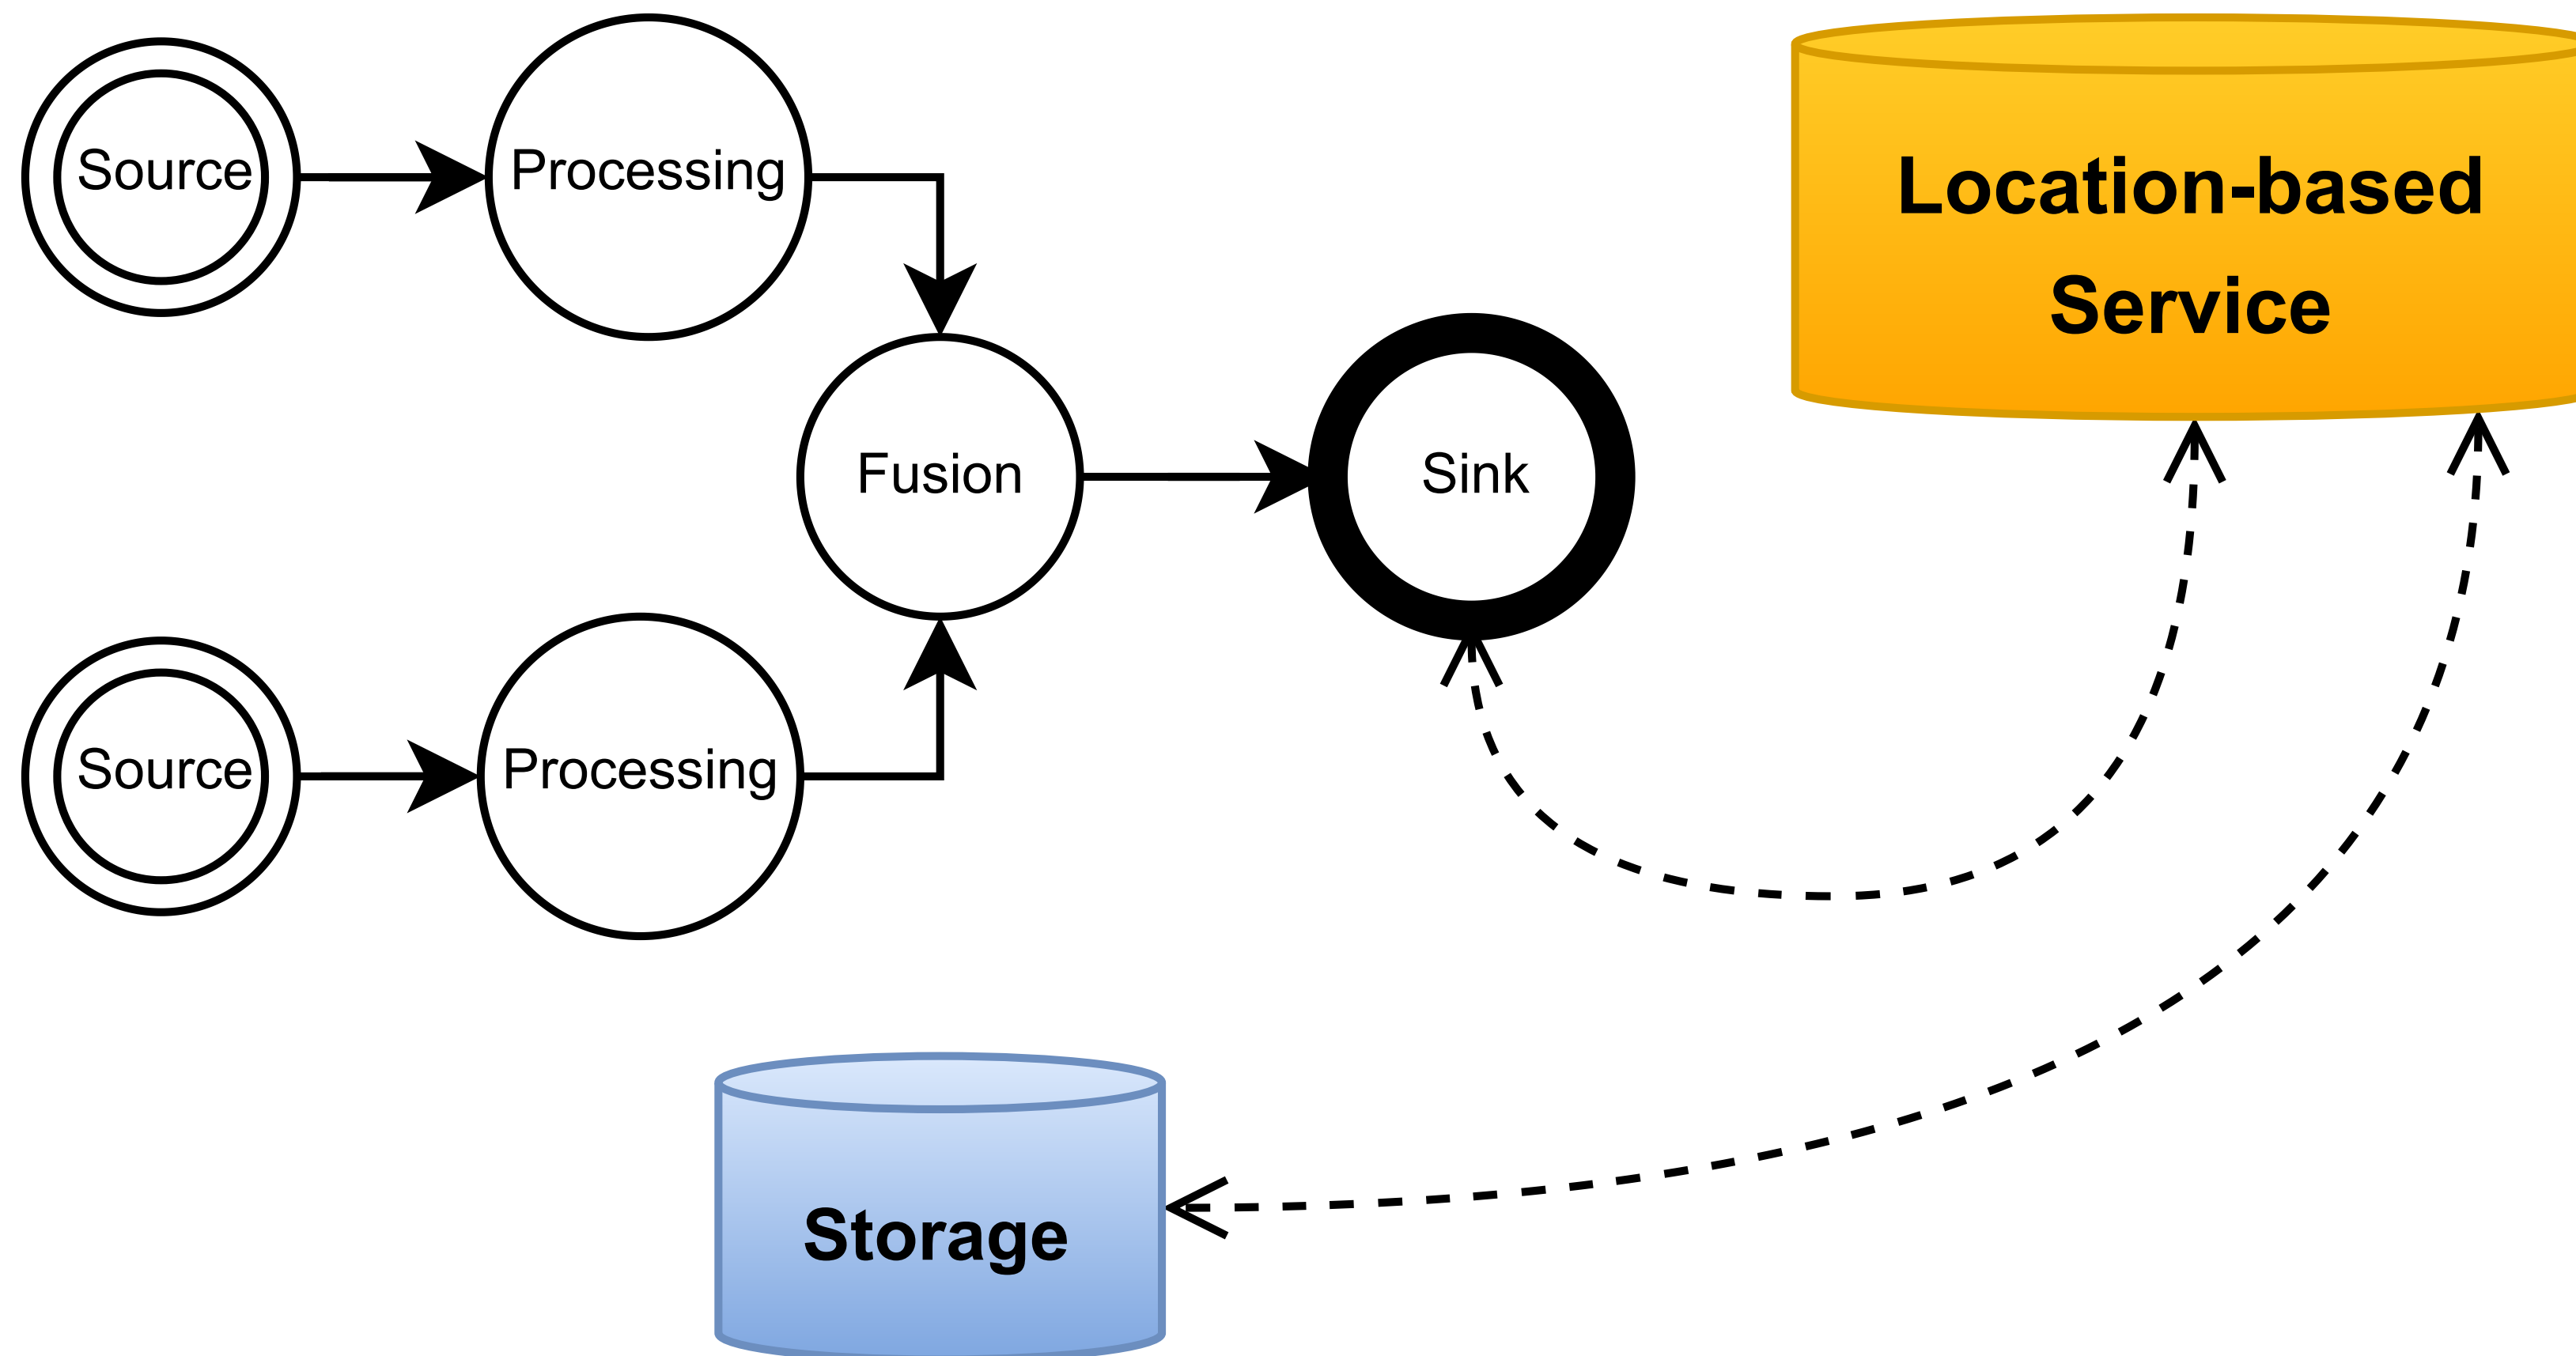

An object that semantically defines a space

- ▶ Spatial hierarchy
- ▶ Graph connectivity with other spaces
- ▶ Geocoding
- ▶ GeoJSON compatibility
- ▶ Can be used as a location
- ▶ Can be extended ...

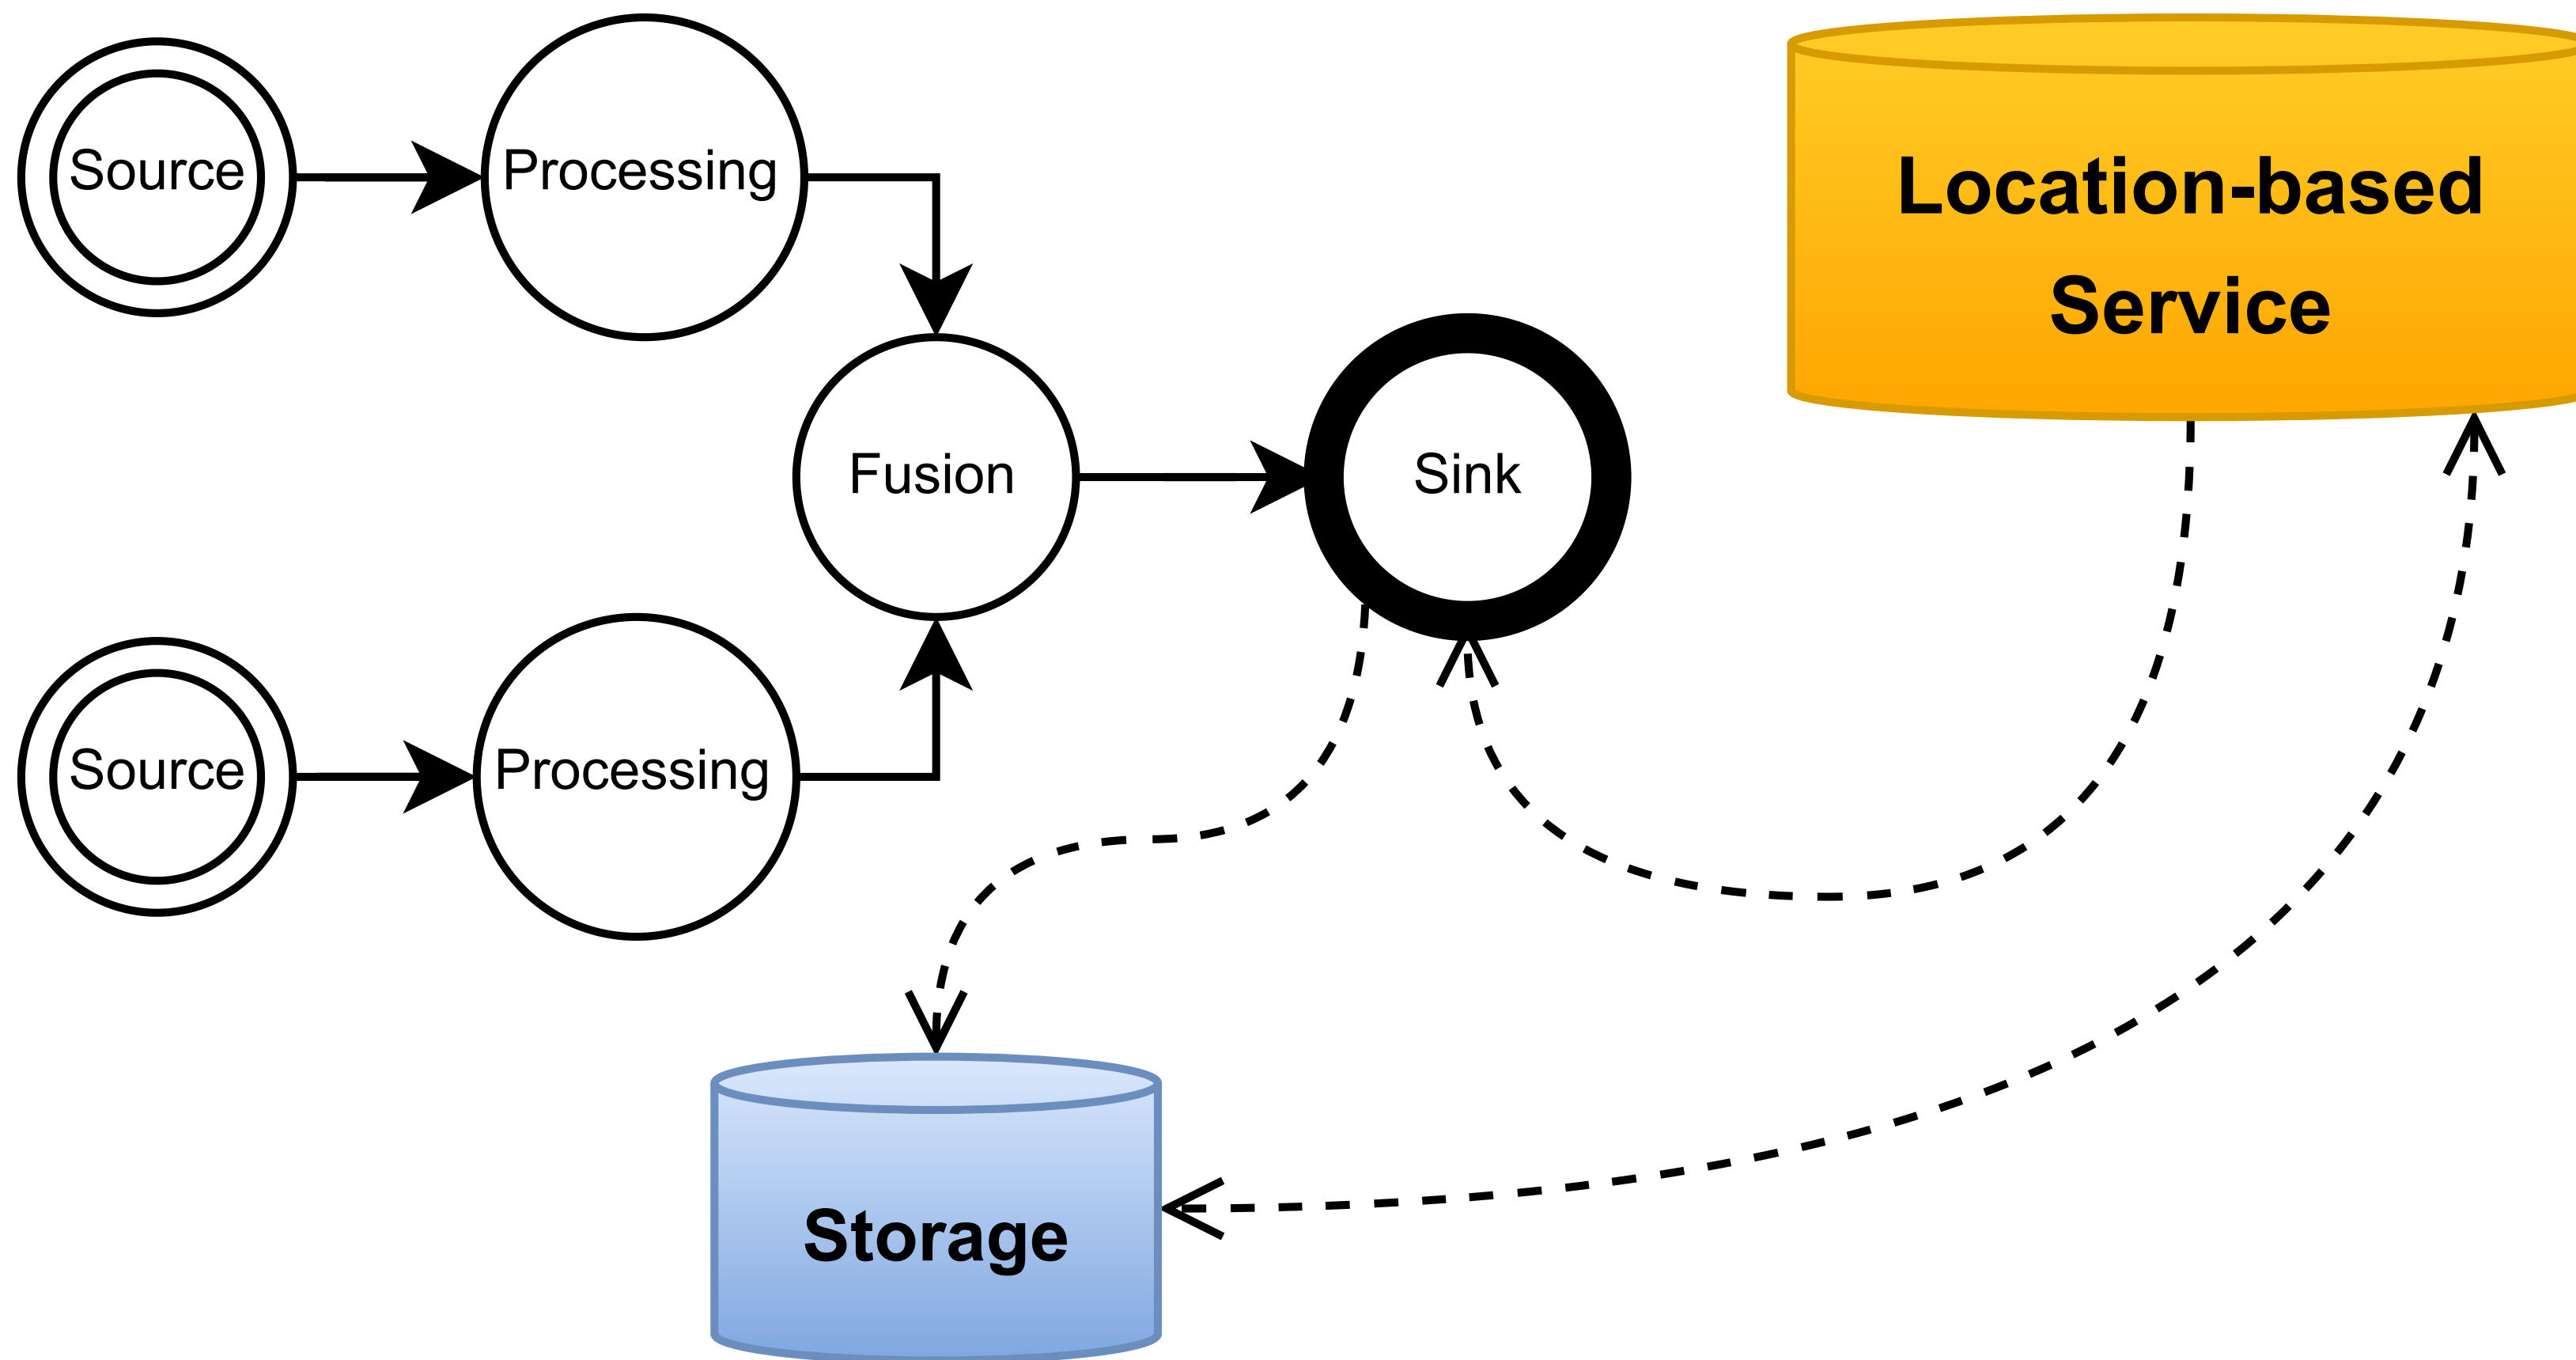

Location-based Service

```
getCurrentPosition("me", ...)
```

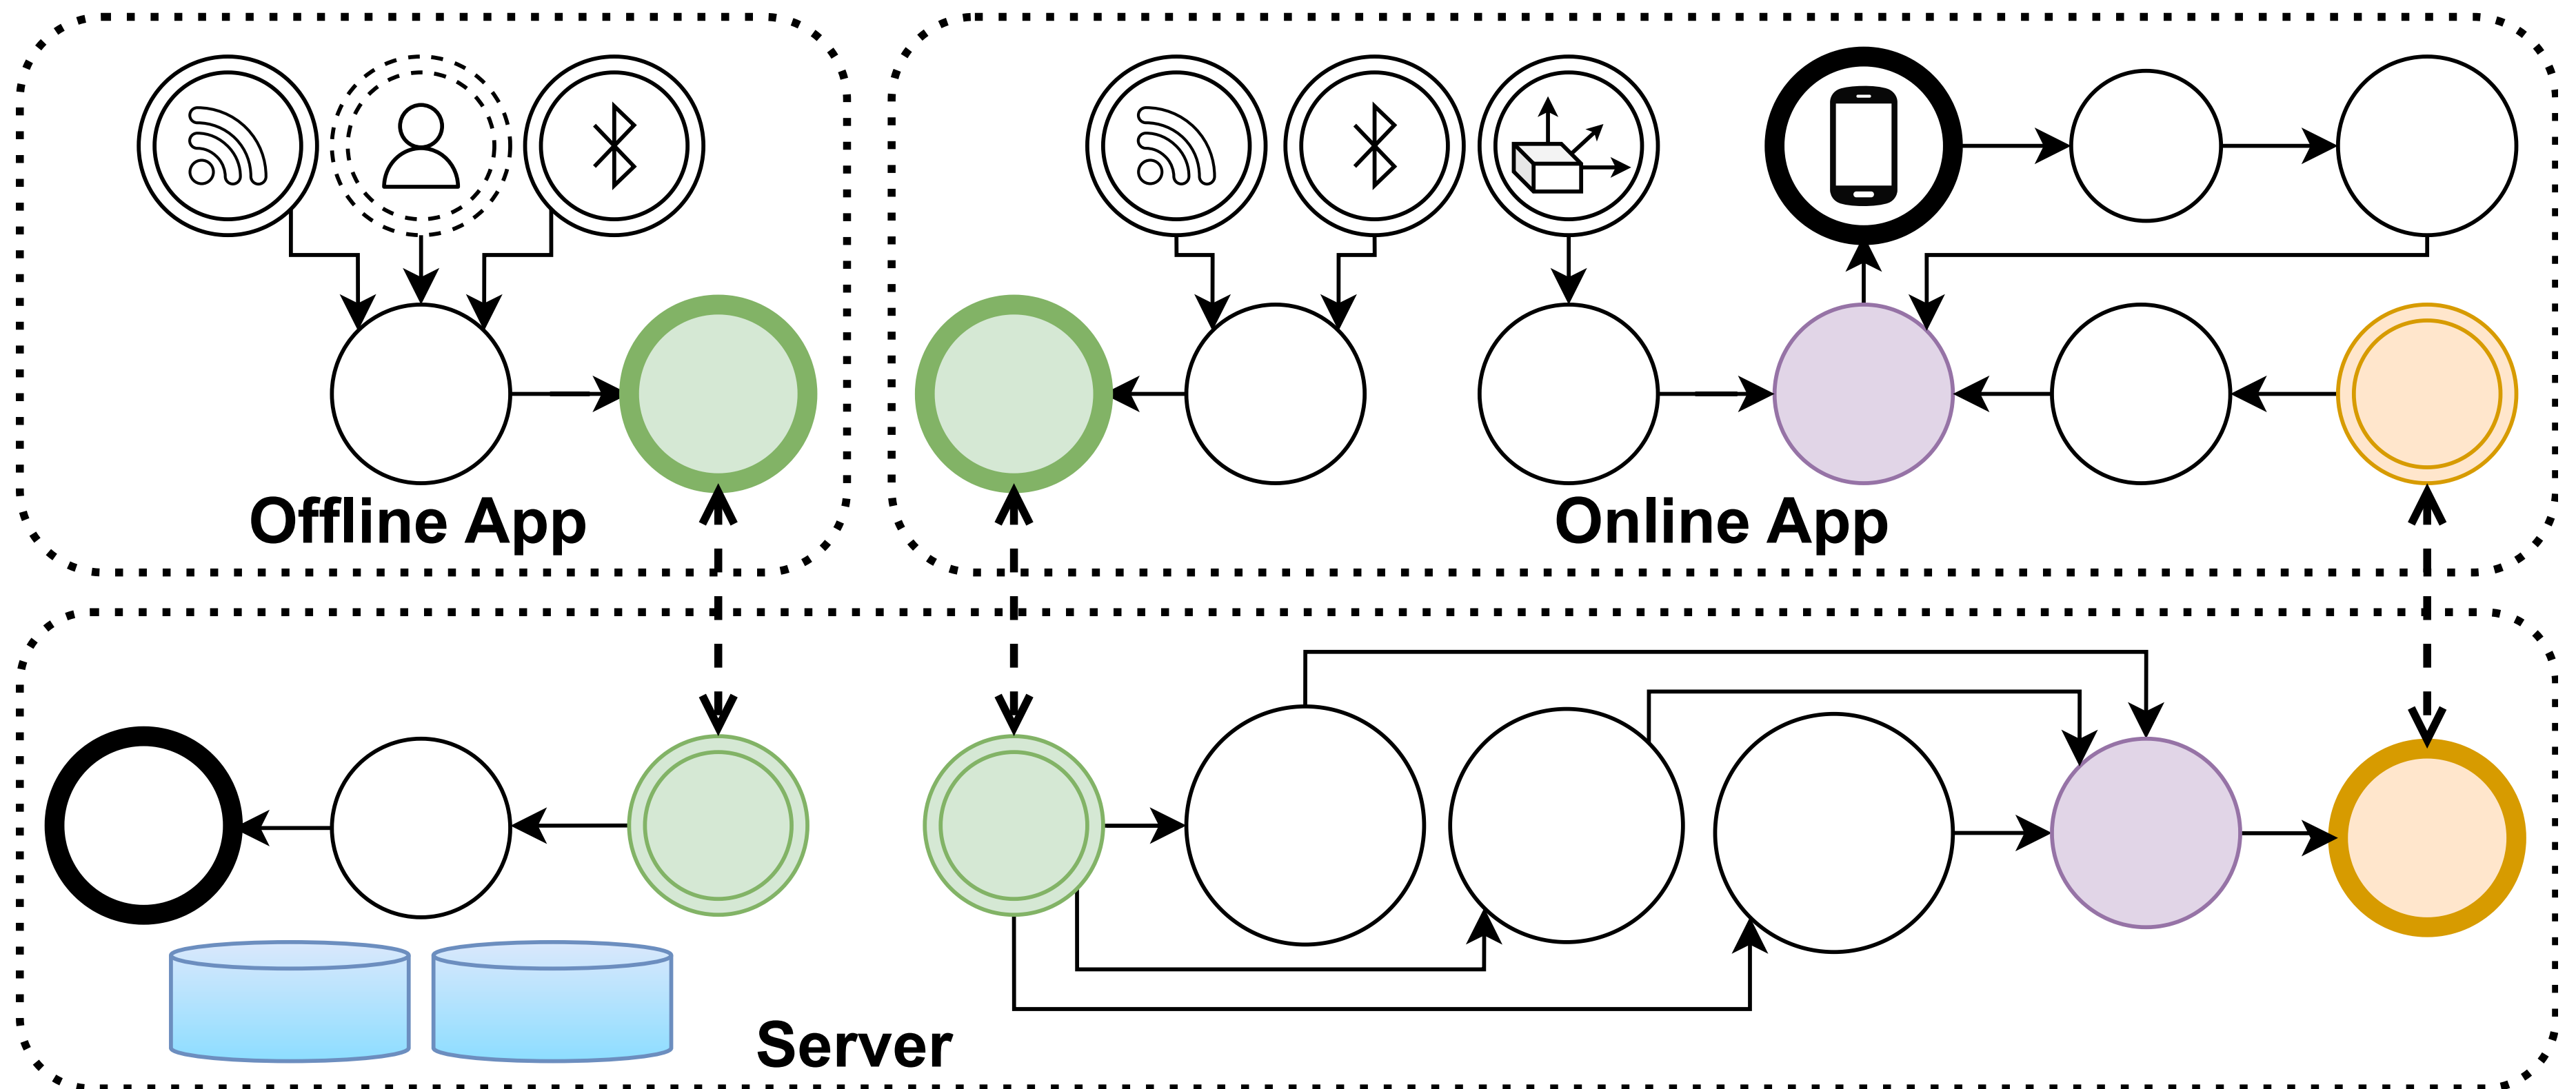

Location-based Service ...

```
watchPosition("me", ...)
```

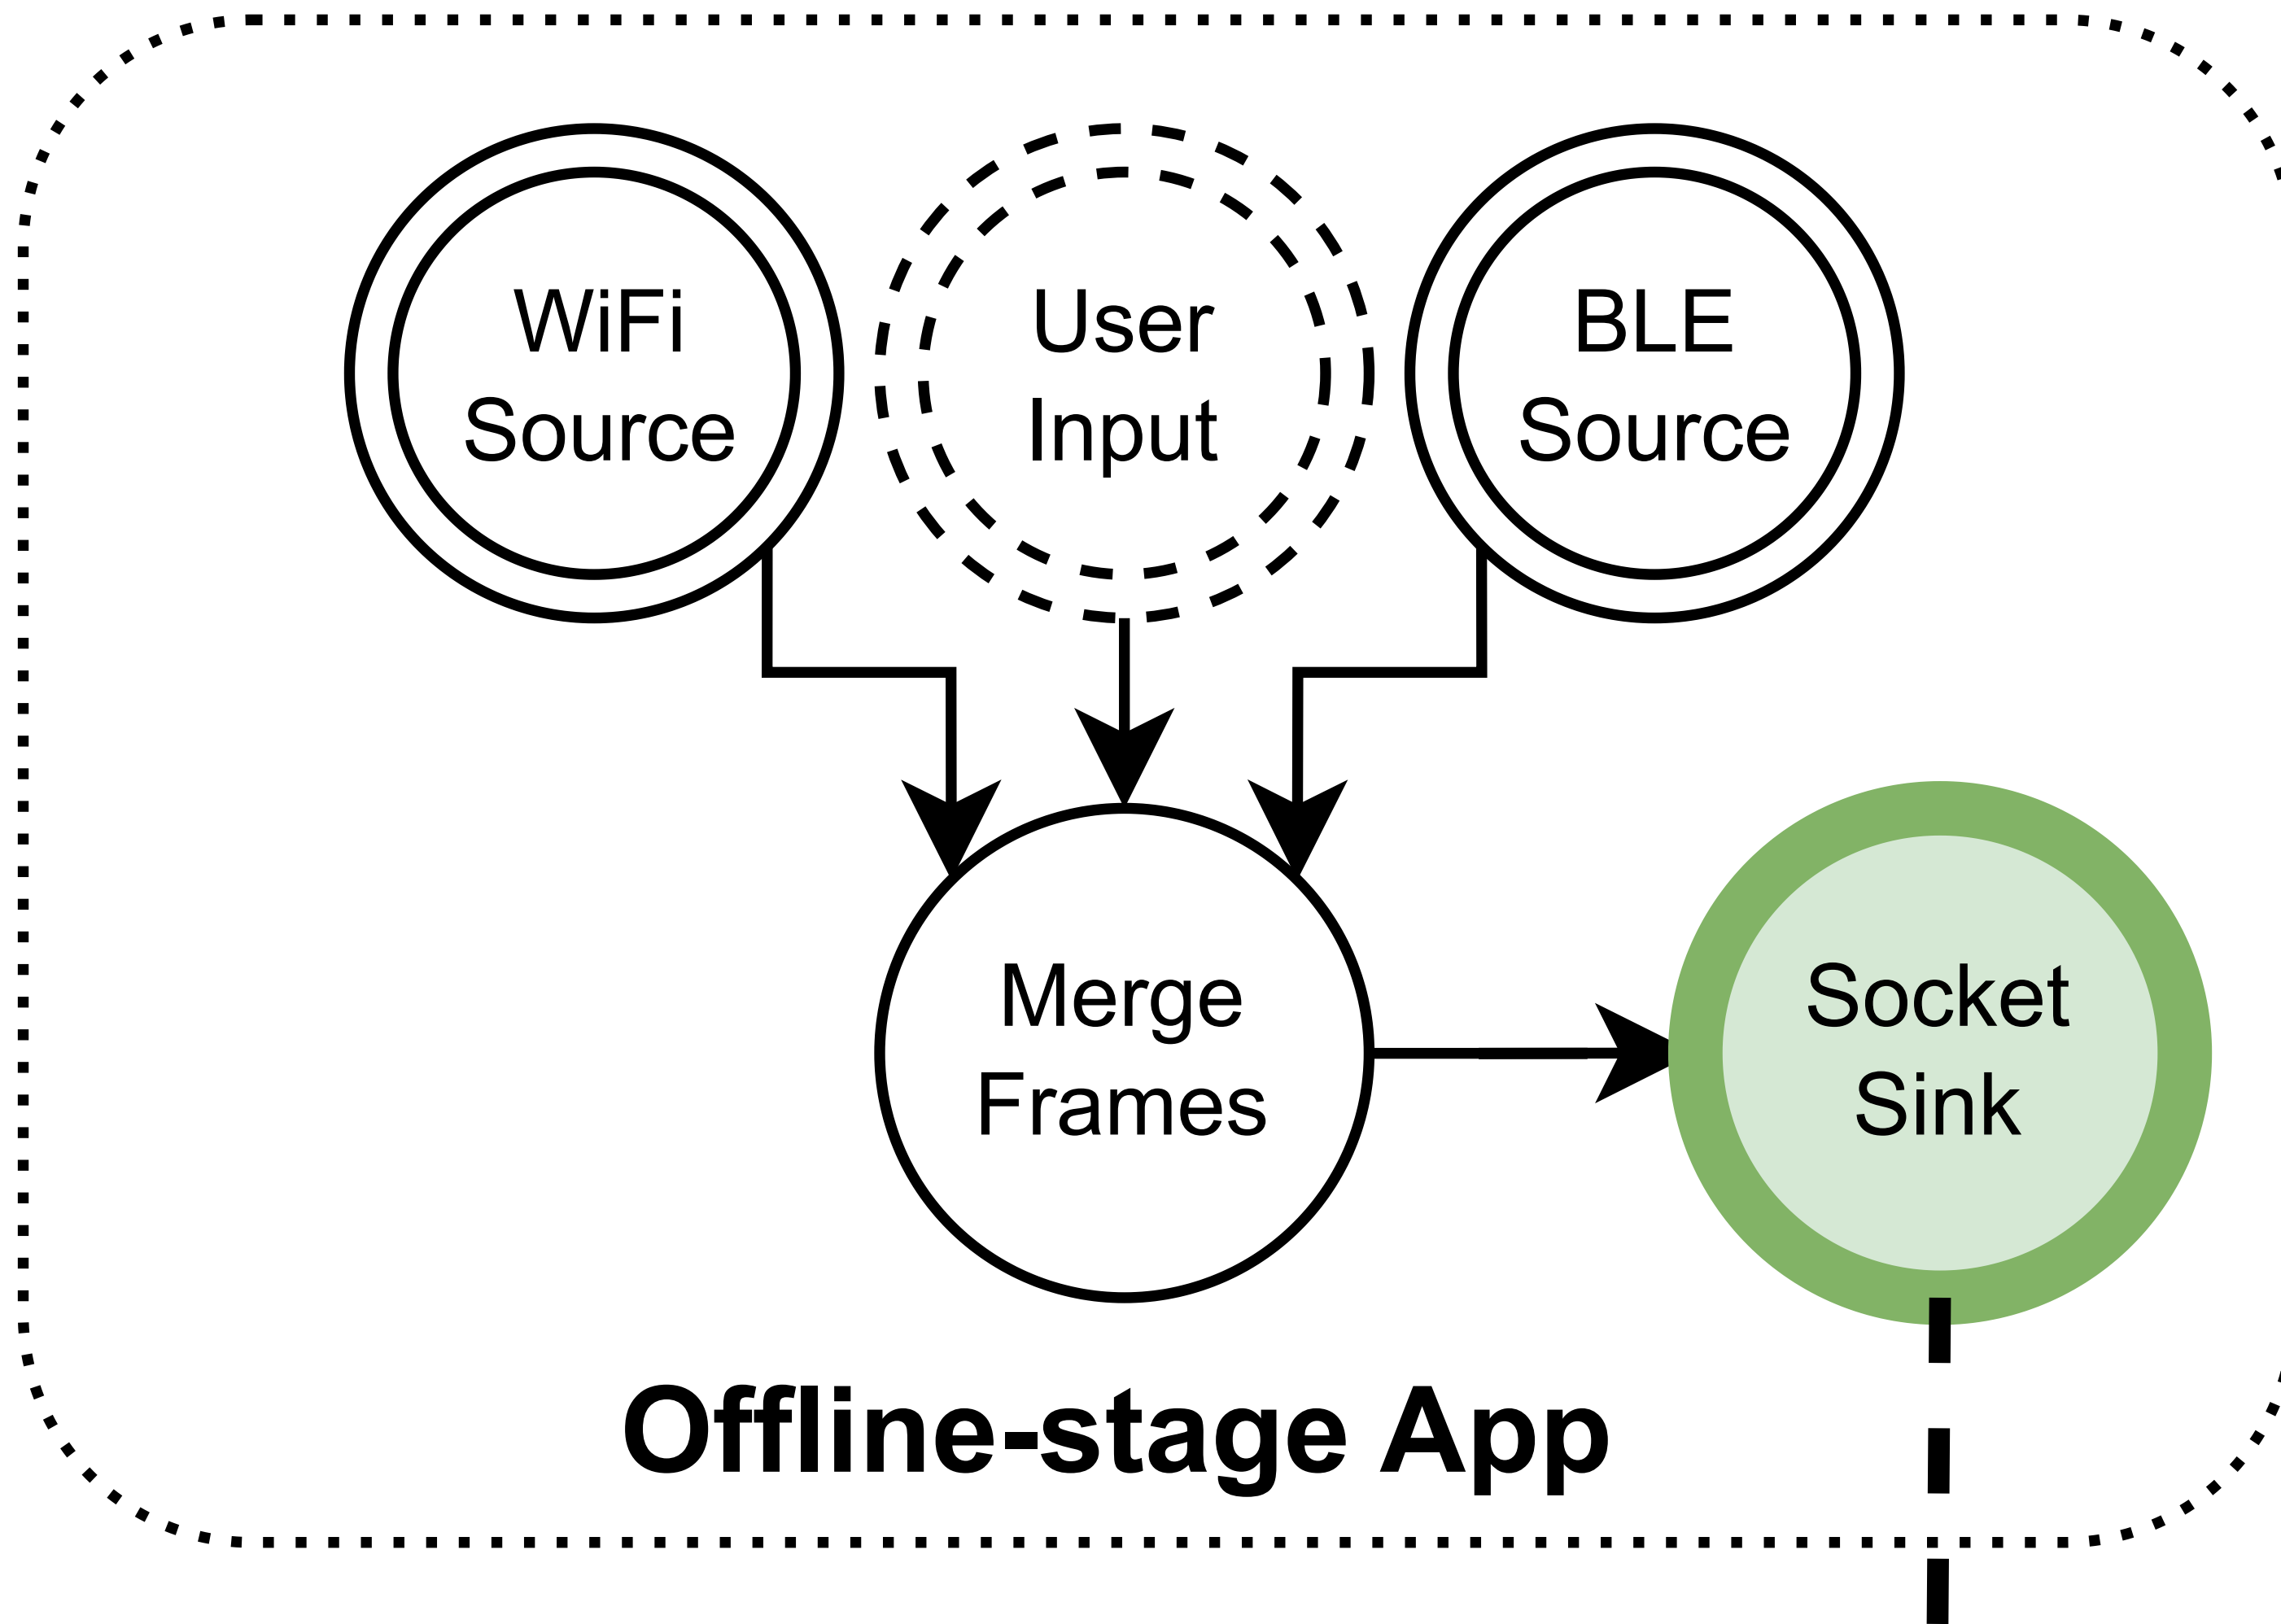

Demonstration

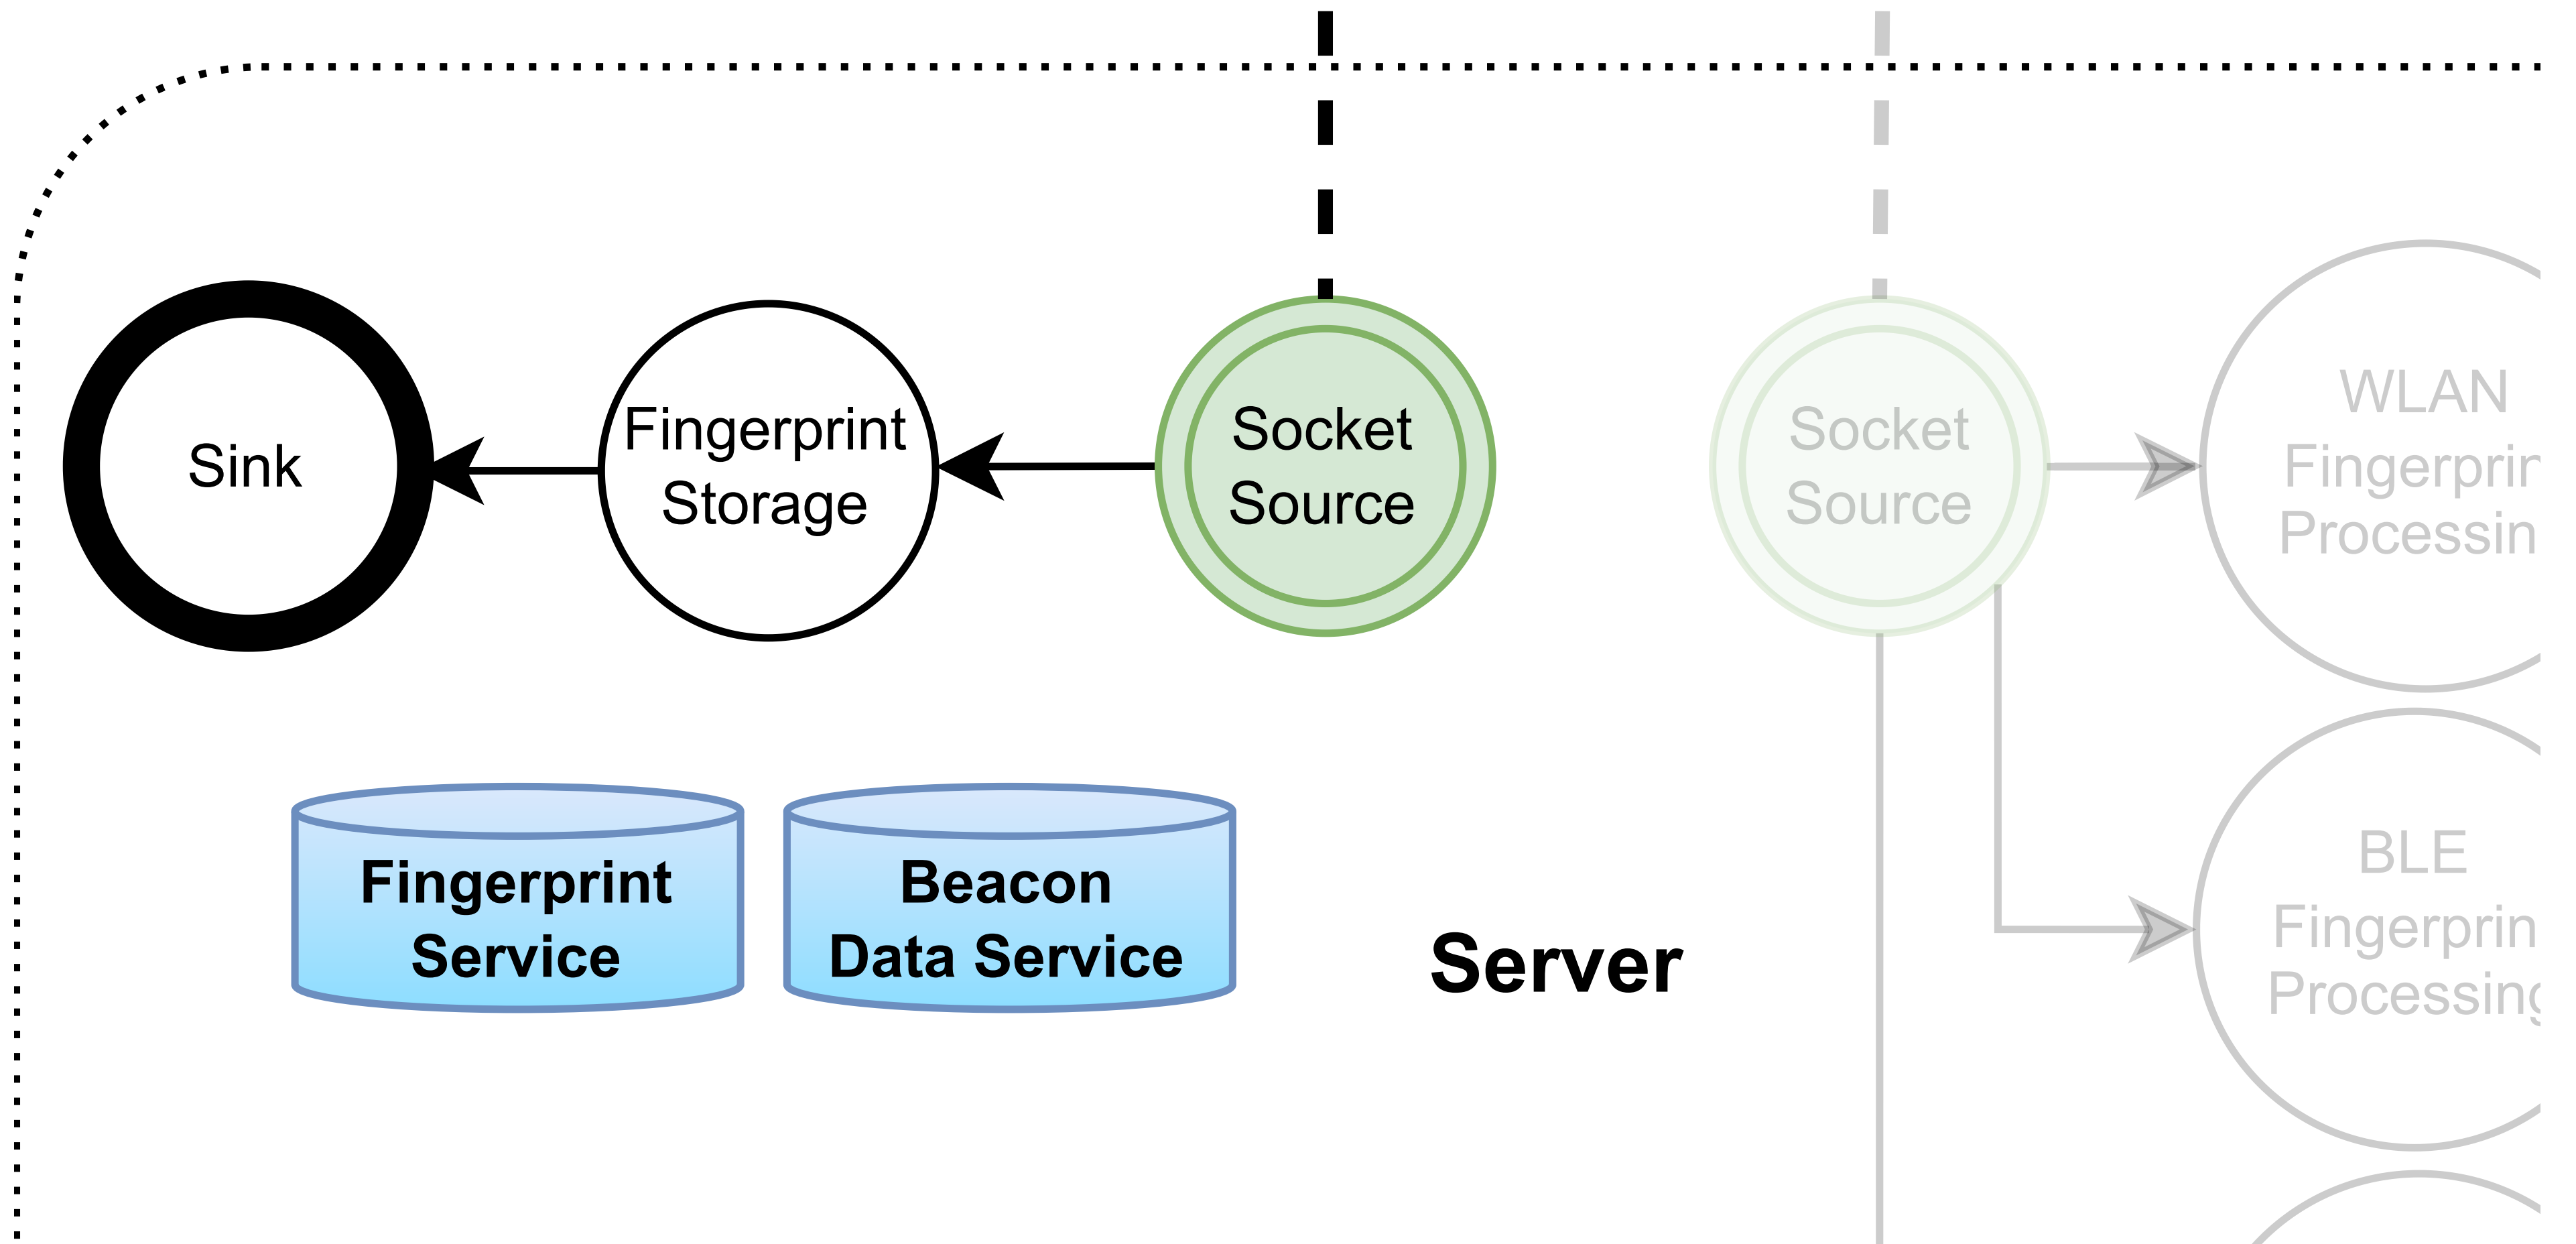

- ▶ Indoor positioning **use case**
- ▶ Use **existing techniques**
- ▶ Validation of **flexibility** and modularity

Validation Results

Static Positioning

	WLAN fingerprinting	BLE fingerprinting	BLE multilateration	Fusion
<i>failed points</i>	0	6	12	0
<i>average error</i>	1.23 m	3.23 m	4.92 m	1.37 m
<i>minimum error</i>	0.01 m	0.17 m	0.74 m	0.01 m
<i>maximum error</i>	4.77 m	15.39 m	19.26 m	9.75 m
<i>hit rate</i>	95.82 %	80.83 %	52.50 %	96.67 %

Validation Results ...

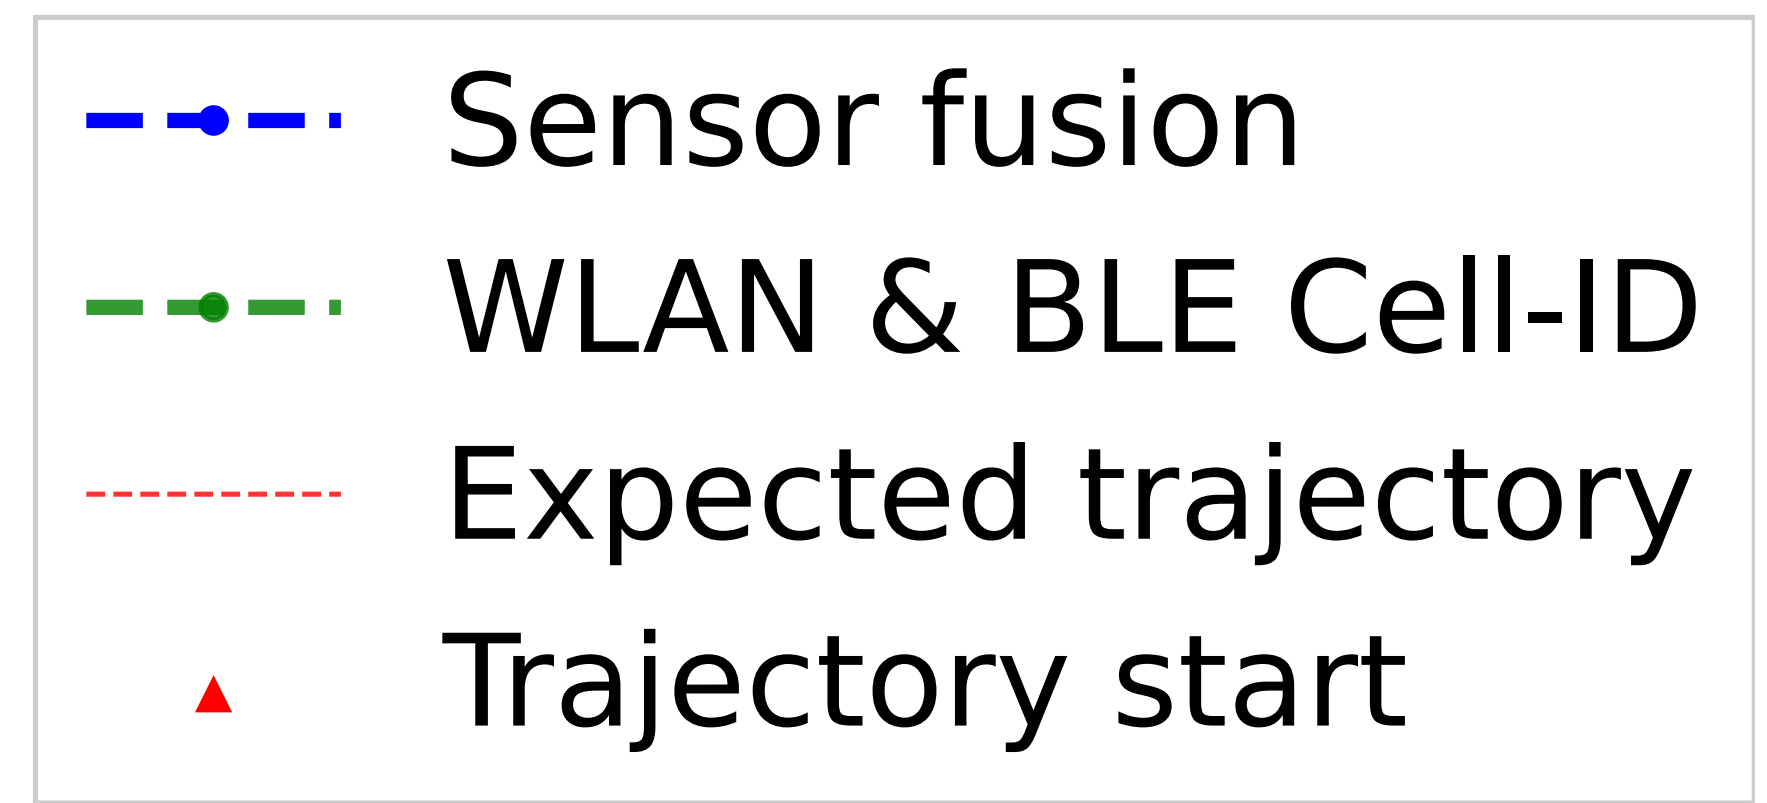

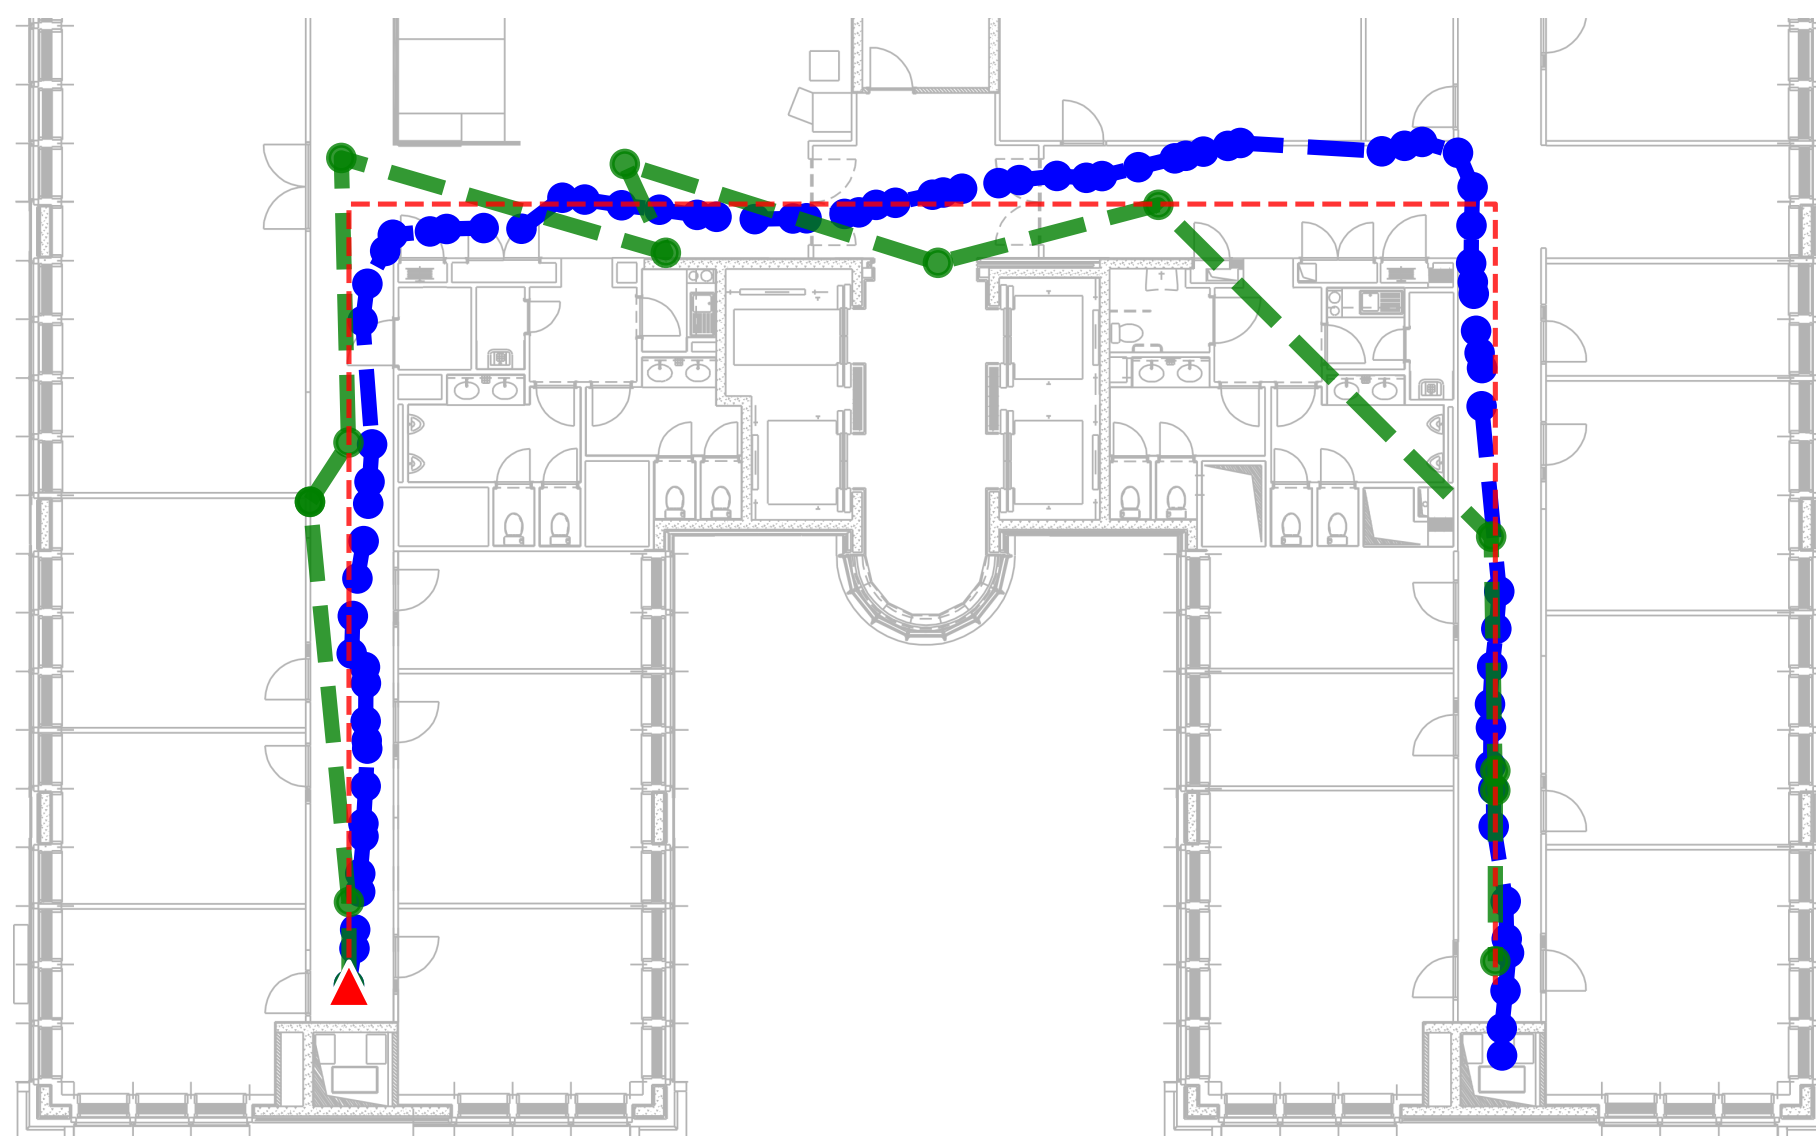

Trajectories

Validation Results ...

Trajectories

	WLAN + BLE	WLAN + BLE + IMU
<i>average error</i>	3.28 m	1.26 m
<i>maximum error</i>	9.60 m	3.10 m
<i>average update frequency</i>	3.04 s	0.52 s

Contributions and Conclusions

- ▶ OpenHPS: **open source** framework for hybrid positioning
 - Aimed towards **developers** and **researchers**
- ▶ **Abstractions** such as location-based services and spaces
- ▶ Validation of an indoor positioning use case
- ▶ Configurable and interchangeable **nodes** and **services**
- ▶ **Public dataset** with multiple orientations
